**Search Hints**

- Engenium's Semetric query engine is an advanced conceptual search engine, documents regardless of structure, content, or length. Semetric moves search keyword queries by inferring the meaning of words based on the context in which they are used. Not only are conceptual relationships measured between words, but the entire document is considered to return the most relevant matches available.
- Queries to Semetric have neither a specific syntax nor reserved-word operators. One or more phrases or sentences that describe the desired concept are sufficient to form an appropriate Semetric query. A phrase such as "semiconductor fabrication" or "wireless interoperability specification" are better examples. To a point, the more descriptive the query, the better. A query could comprise an entire related technology, such as "A flip-chip technology, denominated as DfD (Downset Flip-Chip) technology, is characterized by the forming of a deep hole in the substrate, and by the use of an array of solder bumps over the semiconductor chip and an array of recessed solder-bump pads of an inverted tapered conical shape over the bottom surface of the device hole for electrical connection to the semiconductor chip to the substrate" (from US Patent #6,507,119).
- Note that while all documents are presented to the Semetric engine, at present only those documents that are indexed by the engine are searchable.
